

# Sum of Two Values

Time limit: 1.00 s

Memory limit: 512 MB

You are given an array of  $n$  integers, and your task is to find two values (at distinct positions) whose sum is  $x$ .

## Input

The first input line has two integers  $n$  and  $x$ : the array size and the target sum.

The second line has  $n$  integers  $a_1, a_2, \dots, a_n$ : the array values.

## Output

Print two integers: the positions of the values. If there are several solutions, you may print any of them. If there are no solutions, print IMPOSSIBLE.

## Constraints

- $1 \leq n \leq 2 \cdot 10^5$
- $1 \leq x, a_i \leq 10^9$

## Example

| Input          | Output |
|----------------|--------|
| 4 8<br>2 7 5 1 | 2 4    |
