

Special Substrings

Time limit: 1.00 s

Memory limit: 512 MB

A substring is called *special* if every character that appears in the string appears the same number of times in the substring.

Your task is to count the number of special substrings in a given string.

Input

The only input line has a string of length n . Every character is between a...z.

Output

Print one integer: the number of special substrings.

Constraints

- $1 \leq n \leq 2 \cdot 10^5$

Example

Input	Output
abccabab	5

Explanation: The special substrings are abc, cab, abccab, bccaba and ccabab.
